## Motivation and Background

Nearly $80 \%$ of lung cancer cases are discovered when the disease has already metastasized and survival rates are significantly reduced. Screening is critical to catch the disease in its early, treatable stages. In this study, we consider a screening system based on cavity ring-down spectroscopy (CRDS) analysis of exhaled breath samples. We use machine learning to identify potential biomarkers and develop a classification system for differentiating lung cancer and non-lung cancer individuals.

## Sample Collection

Ten-litre alveolar breath samples were collected onto Tenax TA sorbent tubes for 96 control subjects and 62 pre-treatment, non-small cel lung cancer patients using Picomole's proprietary breath sampler. Participants with other lung conditions such as COPD, asthma, pneumonia and bronchitis were included in both groups ( 36 control subjects and 44 lung cancer subjects).

Picomole Exhaled Breath Sampler

Group Demographics and Clinical Factors

| Factor | Lung Cancer Cohort | Control Cohort |
| :--- | :---: | :---: |
| Sample Size | 62 | 96 |
| Sex |  |  |
| Female | $50 \%$ | $53.1 \%$ |
| Male | $50 \%$ | $46.9 \%$ |
| Age (mean $\pm$ SD, years) |  |  |
| Female (Range) | $68.2 \pm 9.1(47-84)$ | $61.0 \pm 14.3(22-83)$ |
| Male (Range) | $71.3 \pm 8.3(57-83)$ | $65.9 \pm 12.1(35-83)$ |
| Diagnosis |  |  |
| Adenocarcinoma | $58.1 \%$ | - |
| Squamous cell carcinoma | $37.1 \%$ |  |
| Unspecified NSCLC | $4.8 \%$ |  |
| Smoking |  | $6.7 \%$ |
| Current Smokers | $19.4 \%$ | $48.9 \%$ |
| Former | $75.8 \%$ | $44.4 \%$ |
| Non-Smokers | $4.8 \%$ |  |

## CRDS Analysis and Spectral VOC Fitting

The cavity ring-down spectroscopy analysis was performed at four different desorption temperatures for each sample, $75^{\circ} \mathrm{C}, 150^{\circ} \mathrm{C}$ $225^{\circ} \mathrm{C}$ and $300^{\circ} \mathrm{C}$, yielding four spectra consisting of $73 \mathrm{CO} 2\left({ }^{12} \mathrm{C}\right.$ and ${ }^{13} \mathrm{C}$ ) wavelengths.
Stepwise spectral fitting was used to identify VOCs presented in each spectrum. Compound spectra from a reference library of 152 VOCs were iteratively added and removed from each fit based on the Akaike Information Criterion.

## Machine Learning Methods

Six different data transformations were considered for the VOC concentrations: $\log _{e}(X), \log _{e}(X+1), \log _{10}(X), \log _{2}(X), X^{1 / 2}$, and $X^{1 / 3}$.
For each data transformation, the top VOCs were selected using minimum redundancy maximum relevance (mRMR) feature selection. This algorithm ranks features sequentially based on a difference of Pearson correlations: the feature's correlation with the group membership labels minus its correlation with other features.

Linear support vector machines were trained and validated using leave-one-subject-out cross-validation to evaluate each set of top ranked mRMR features.

## Results

The best leave-one-subject-out classification performance was achieved using 30 features ( 26 unique compounds) with a $\log _{e}(X)$ transform: accuracy $85.44 \%$, sensitivity $77.42 \%$, specificity $90.63 \%$, and AUC 0.858.

Untransformed Concentrations for Best Performing Feature Set

| \# | Feature | Lung Cancer ( $\mu \pm \sigma \mathrm{ppbv}$ ) | Control ( $\mu \pm \sigma \mathrm{ppbv}$ ) |
| :---: | :---: | :---: | :---: |
| 1 | Dimethyl sulfide $\left(75^{\circ} \mathrm{C}\right)^{\dagger}$ | $0.302 \pm 0.747$ | $0.024 \pm 0.134$ |
| 2 | Octafluoropropane ( $300^{\circ} \mathrm{C}$ ) | $1.295 \pm 4.091$ | $5.879 \pm 33.198$ |
| 3 | Isopropanol ( $\left.150^{\circ} \mathrm{C}\right)^{\star+}$ | $0.178 \pm 0.555$ | $0.023 \pm 0.173$ |
| 4 | D-Limonene ( $150^{\circ} \mathrm{C}$ ) | $0.029 \pm 0.162$ | $0.353 \pm 1.182$ |
| 5 | 1,2-Dichlorobenzene ( $150^{\circ} \mathrm{C}$ ) | $0.021 \pm 0.094$ | $0 \pm 0$ |
| 6 | Trifluoromethane ( $\left.225{ }^{\circ} \mathrm{C}\right)^{*}$ | $0.242 \pm 1.012$ | $0 \pm 0$ |
| 7 | Menthol ( $150^{\circ} \mathrm{C}$ ) | $0.153 \pm 0.859$ | $0 \pm 0$ |
| 8 | n-Undecane $\left(300^{\circ} \mathrm{C}\right)^{\dagger}$ | $0.770 \pm 2.720$ | $0 \pm 0$ |
| 9 | Diethyl ketone ( $150^{\circ} \mathrm{C}$ ) | $0.397 \pm 1.713$ | $0 \pm 0$ |
| 10 | 2,3-Dimethylbutane ( $225^{\circ} \mathrm{C}$ ) | $1.569 \pm 5.064$ | $0.200 \pm 1.180$ |
| 11 | 2-Nonanone $\left(75^{\circ} \mathrm{C}\right)^{\dagger}$ | $0.150 \pm 0.931$ | $1.319 \pm 4.315$ |
| 12 | n-Tetradecane ( $75^{\circ} \mathrm{C}$ ) | $0.132 \pm 1.036$ | $1.473 \pm 4.351$ |
| 13 | Formic acid ( $755^{\circ} \mathrm{C}$ ) | $0.014 \pm 0.089$ | $0.054 \pm 0.190$ |
| 14 | Furfural ( $300^{\circ} \mathrm{C}$ ) | $0.186 \pm 0.561$ | $0.054 \pm 0.319$ |
| 15 | tert-Butyl alcohol ( $\left.150^{\circ} \mathrm{C}\right)^{*}$ | $0.135 \pm 0.245$ | $0.072 \pm 0.215$ |
| 16 | $3-\mathrm{Carene}\left(75^{\circ} \mathrm{C}\right)$ | $0.076 \pm 0.366$ | $0 \pm 0$ |
| 17 | Methanol ( $\left.300^{\circ} \mathrm{C}\right)^{\dagger}$ | $0.065 \pm 0.174$ | $0.511 \pm 3.572$ |
| 18 | 1 -Undecene ( $150^{\circ} \mathrm{C}$ ) | $0.132 \pm 0.444$ | $0.025 \pm 0.149$ |
| 19 | Ethyl butyrate ( $300^{\circ} \mathrm{C}$ ) | $0.274 \pm 0.837$ | $0.055 \pm 0.280$ |
| 20 | Ethyl tert-butyl ether ( $\left.225^{\circ} \mathrm{C}\right)^{*}$ | $0.034 \pm 0.136$ | $0.002 \pm 0.016$ |
| 21 | Isopropanol ( $\left.75^{\circ} \mathrm{C}\right)^{\star+}$ | $1.667 \pm 1.994$ | $0.914 \pm 1.767$ |
| 22 | Ethyl tert-butyl ether ( $\left.75^{\circ} \mathrm{C}\right)^{*}$ | $0.323 \pm 0.782$ | $0.110 \pm 0.385$ |
| 23 | 2-Methyl-1-propanal ( $75{ }^{\circ} \mathrm{C}$ ) | $0 \pm 0$ | $0.147 \pm 0.581$ |
| 24 | 1,2,3,5-Tetramethylbenzene ( $75^{\circ} \mathrm{C}$ ) | $0.458 \pm 2.577$ | $0 \pm 0$ |
| 25 | Isopropylamine $\left(75^{\circ} \mathrm{C}\right)^{\dagger}$ | $0.638 \pm 1.891$ | $0.194 \pm 1.178$ |
| 26 | Hexanal $\left(300^{\circ} \mathrm{C}\right)^{\dagger}$ | $0 \pm 0$ | $0.245 \pm 1.145$ |
| 27 | Propylene sulfide ( $225^{\circ} \mathrm{C}$ ) | $0.034 \pm 0.162$ | $0 \pm 0$ |
| 28 | 1-Hexanoic acid ( $75^{\circ} \mathrm{C}$ ) | $0.152 \pm 1.117$ | $0.361 \pm 1.050$ |
| 29 | Trifluoromethane ( $\left.75^{\circ} \mathrm{C}\right)^{*}$ | $0.119 \pm 0.935$ | $1.218 \pm 7.274$ |
| 30 | tert-Butyl alcohol ( $75^{\circ} \mathrm{C}$ )* | $0.098 \pm 0.197$ | $0.037 \pm 0.120$ |

* VOC selected twice from different temperature spectra
† VOC found to differ between lung cancer and control subjects in other works

## Conclusions

These preliminary results show promise for a novel exhaled breath based screening system using infrared CRDS technology and spectral VOC fitting. We have previously built a model for this data using spectral patterns as classification features (rather than VOC concentrations), which achieved similar accuracy. Future work will compare the two approaches.
